

As we age, gravity and muscle action create changes in the tension and elasticity of facial skin. This leads to sagging skin, wrinkles, creases and deep grooves around the mouth and in the forehead. Many of our patients are concerned with correcting these outward signs of aging as well as other physical imperfections in the facial area.

Smart Cone Lift

Our practice now offers a new, more economical, non-surgical procedure called a **Smart Cone / Silhouette Lift** which uses a new FDA approved suture called the Silhouette suture to provide a lasting lift to sagging facial tissues without the expense and prolonged recovery of a full facelift. The procedure is safe, simple, and conservative and leaves no visible traces of the procedure on the skin. It can make a patient look younger.

Who are the best candidates?

The best candidates are patients with:

- Mild to moderate sagging of soft tissues of the face and neck
- Premature aging and sun damage
- Weakly pronounced aesthetic features and contours
- A flaccid, flat face

How does a Smart Cone Lift work?

The SmartCone Lift uses an entirely new suture for lifting and repositioning soft tissue. The unique, two-stage Silhouette fixation process lifts and holds repositioned tissues in place. This suture is made with tiny knots and absorbable, lifting cones, spaced in the appropriate position to lift and hold soft tissue. This patented suture allows your body's tissues to slowly grow into and around the knots as the lifting cones are slowly absorbed, leaving your skin smooth and barb free. Since the Silhouette suture is not a barbed suture, it can easily be removed, if desired, after the cones are fully absorbed.

How does a Smart Cone Lift differ from a conventional facelift?

A Smart Cone Lift is a much less invasive procedure. As a result, it only requires local anesthesia so there is much less risk and no recovery due to the general anesthesia that is required for a facelift. A Smart Cone Lift is done on an out-patient basis in our office.

What is recovery like?

Following a Smart Cone Lift downtime is minimal. You probably won't even need bandages. However, you may want to apply some ice to reduce swelling. Most patients resume full normal activities in two to three days.

To find out if you could be a candidate for a **Silhouette Lift/Smart Cone Lift**, please schedule a consultation with our doctor at **Siam Swan Cosmetic Clinic**

How is a Smart Cone Lift performed?

The procedure is done using local anesthesia and can take from thirty minutes to one hour. Your doctor gently threads the silhouette suture through your sagging tissues and then retracts it. This gentle retraction causes the cones to lock onto and lift the sagging tissues, allowing your doctor to reposition them under the skin. Once in position, your body begins generating new collagen around each cone to hold them in place.

What areas respond the best to a Smart Cone Lift?

- Cheeks can be lifted
- Jowls can be elevated and reduced
- Neck and jaw lines can be tightened

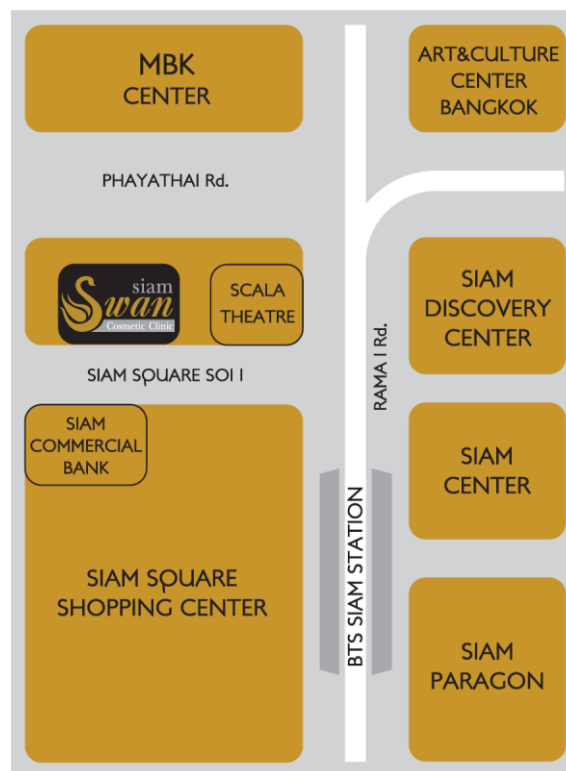

What about scars?

Since the procedure is performed with needles there are only tiny scar hidden in the hair.

How long do the results last?

Most Smart Cone Lift patients are happy with their results, which are holding tightly about three years. At that time, you can come back for re-tightening without any downtime.
